

BTG: Content Management System & Modules:

1. **Main Install:** Contains user management and news tools as well as the controls more managing themes and modules. I will also allow the Administrators to customize the users signup and the “legal” documents
2. **News:** Although this module is installed with the main install it has some features that need mentioning. First of all it allows users to post comments on it in the forums along with a “Send to a Friend” link. It will also support having both long and short stories. With the long stories being summarized for the main page and a “Read More” link being placed on the bottom of the news article
3. **Forums:** These are a hacked version of vBulletin and require a license to work. The main thing that is different from a normal release of vBulletin is that its themes change as you change the CMS’s themes.
4. **Photo Gallery:** This is just what it says. It allows members to upload photos to the page so that they can be viewed by others.
5. **Buddies List:** I got this idea from vBulletin where users can add each other so that they can see when “Buddies” are online. They are able to Private Message them and Email them from the “Buddies Box”.
6. **Links:** This is a link manager as found on a lot of other sites. It had the ability to add/edit/remove links from the database as long as you are the user who added them or an administrator
7. **Projects:** This module allows a site administrator to add a project which users can join and help with. This is a “limited market” module and therefore will be one of the last done
8. **Chat:** This module is something that other CMS’s are missing. An IRC chat module. This module will have a hacked version of jIRC to work.
9. **Awards:** This module allows administrators the ability to give users “Awards” these will be titles mainly that the user can then choose to use.
10. **Contact Us:** This again is another thing that most CMS’s are missing these days. The module will support multiple E-Mail addresses so that the mails can be sent to the correct admin
11. **Frequency Board:** This module is for Radio Control modeling clubs and will allow users to post radio frequencies they use on the “board”

12. **Download Manager:** This module allows users to add downloads to the “library”. The user can choose to have the download “reviewed” by an administrator to see if it will be put on the sites server. You can add/edit/remove links from the database as long as you are the user who added them or an administrator
13. **Calendar:** This module will allow users to add events and dates both privately and for the group. All users who enter their birthday in registration will have the date marked on here unless they choose otherwise
14. **Polls:** This module will allow administrators to add polls to the site. It will also allow users to suggest polls.
15. **Site Statistics:** This module will allow users (if allowed by administrator) to see the statistics for the site as well as the administrators.
16. **User Profiles:** This module will allow users to have a profile about themselves on the site.
17. **Counter:** This module will place a counter in the “footer” of the page
18. **Visual Basic Front End:** This will be a simple web browser that is able to be used by the sites administrators

More modules to come. Please feel free to suggest any.
